Acknowledgments

The authors of this report—Mary Kopczynski and Mark Hager of the Urban Institute—are grateful to Marian Godfrey, Stephen Urice, and Shelley Feist of The Pew Charitable Trusts for their generous and enthusiastic support of this effort.

We are also grateful for the leadership provided by the Performing Arts Research Coalition and its participants: Marc Scorca and Donald Delauter from OPERA America; Charles “Chuck” Olton, Jack McAuliffe, and Jan Wilson from the American Symphony Orchestra League; Sandra Gibson, Jon Durnford, and Shawn Sample from the Association of Performing Arts Presenters; Andrea Snyder and John Munger from Dance/USA; and Ben Cameron, Chris Shuff, and Joan Channick from Theatre Communications Group.

Finally, we wish to thank Elizabeth Boris and Harry Hatry from the Urban Institute for their guidance throughout the project; Sarah Wilson for her assistance in managing key aspects of data collection; and Frank Wilkosz for his assistance with data analysis and table preparation. Errors are those of the authors, whose views do not necessarily represent those of the Urban Institute, the Performing Arts Research Coalition, or The Pew Charitable Trusts.

Participating Local Organizations

The Performing Arts Research Coalition gratefully recognizes the support and involvement of the participating organizations in each community.

ABOUT THE PARC PROJECT

The Performing Arts Research Coalition (PARC) brings together five major national service organizations (NSOs) in the performing arts—the American Symphony Orchestra League, the Association of Performing Arts Presenters, Dance/USA, OPERA America, and Theatre Communications Group—to improve and coordinate the ways performing arts organizations gather information on their sector.

The unprecedented collaborative effort is coordinated by OPERA America and supported by a three-year, \$2.7 million grant to OPERA America from The Pew Charitable Trusts.

Working with the Urban Institute, a leading nonprofit research organization in Washington, D.C., the project is collecting data in 10 pilot communities: Alaska, Cincinnati, Denver, Pittsburgh, Seattle, Austin, Boston, Minneapolis/St. Paul, Sarasota, FL, and Washington, D.C.

Information is being gathered on administrative expenditures and revenues of performing arts organizations, the value of the performing arts as experienced by both attenders and nonattenders of arts events, and audience and subscriber satisfaction with performances and related activities.

The findings from these various research activities are expected to help performing arts organizations across the country improve their management capacity, strengthen their cross-disciplinary collaboration, increase their responsiveness to their communities, and strengthen local and national advocacy efforts on behalf of American arts and culture.

Research findings will be available each year of the initiative and a summary analysis will be released in 2004. The national service organizations are regularly sharing findings with their members, policymakers, and the press, indicating how this information could be used to increase participation in and support for the arts, locally and nationally.

For further information, please contact OPERA America at (202) 293-4466.

Section 6: Methodology 64

Preface

The Performing Arts Research Coalition—PARC—provides a historic opportunity for five service organizations to work together in an unprecedented three-year project to measure the level of participation in and support for the arts in 10 communities across the country.

The first findings from that project—the results of household surveys conducted in Alaska, Cincinnati, Denver, Pittsburgh and Seattle—are now available. They enable us to draw for the first time a detailed picture of the value of the performing arts to individuals and their communities, and offer a greater understanding of the perceived obstacles to greater attendance.

The findings are extremely encouraging. They reveal an arts audience far larger and more diverse than currently believed, comparable in size to audiences for movies and sports. Support for the performing arts also appears to be broad, with far-reaching cultural, social, and educational implications. Attendance at arts events, for example, was perceived by attenders and nonattenders alike to be of significant value to communities, and especially important to the development and education of children. Several attendance barriers cited were primarily perceptual; for example, potential audiences did not fully appreciate the ease of attending performances and the accessibility of the arts experience.

Such information should be useful to a variety of stakeholders, including policymakers evaluating the role of government in supporting the arts; funders needing hard data on which to base and increase their financial support of the arts; media seeking a wider consumer base; and managers of arts organizations tackling the twin challenges of increasing and diversifying their audiences.

The size and breadth of the performing arts audience also suggest an appetite for expanded arts coverage in newspapers, radio, and television, and that arts coverage should perhaps be considered in broader terms than performance reviews. Grantmakers may be interested in placing their arts support in the larger context of the range of civic benefits that derive from arts attendance.

Local initiatives that improve parking and reduce perceived and real obstacles to convenience and safety could have a significant impact on the size of the arts audience and frequency of attendance, particularly if such efforts are combined with communication strategies that introduce more people to the arts experience.

We invite you to review on the following pages these common threads and to reflect on the vibrant picture they paint of the high levels of participation in and appreciation for the performing arts in these five communities. In closing, PARC wishes to convey how indebted the coalition is to the generous support of The Pew Charitable Trusts and to the outstanding service of the Urban Institute in designing and administering this project.

PARC Project Coordinator

Highlights from the Five Communities

Following are the key findings from the five household surveys for Alaska, Cincinnati, Denver, Pittsburgh, and Seattle. The findings cover participation rates, characteristics of attenders, perceived value of the performing arts to individuals and to communities, and barriers to greater attendance.

PARTICIPATION RATES

The research indicates that attendance at live professional performing arts events, at least on an occasional basis, is an activity enjoyed by a significant majority of adults in the five communities studied. The notion that the performing arts appeal only to a narrow segment of the general public does not appear to be accurate.

- **Attendance Levels:** Nearly two-thirds of respondents reported attending a live professional performing arts event in the past 12 months. These numbers range from 69 percent (in Alaska) to 61 percent (in Pittsburgh). Frequent attenders, defined as those who attended at least 12 performances over the past year, range from 18 percent of respondents (in Denver) to 12 percent (in Cincinnati).
- **Arts vs. Sporting Events:** In all five communities, more people have attended a live performing arts event at least once in the past year than have attended a professional sporting event. However, arts attenders are active citizens who participate in a wide range of activities and volunteer for a variety of community organizations.
- **Performing Arts and Leisure Activities:** The research confirms that frequent performing arts attenders are also the most frequent attenders of other leisure activities, including sporting events, movies, festivals, museums, and popular concerts. Attenders were generally more involved with these activities than nonattenders of performing arts events. Rather than an “arts” versus “other activities” distinction, the findings suggest that people generally are either involved in community activities (be it attendance at performing arts activities or otherwise) or they are not.

- **Performing Arts and Volunteering:** In all five communities, arts attenders and frequent arts attenders are considerably more likely to volunteer than are nonattenders—not just for arts organizations, but generally in their community. Although there is clear evidence to support this relationship, the data cannot be used to suggest that attendance at performing arts results in higher levels of volunteerism. Nonetheless, arts attenders display characteristics that are conducive to greater civic engagement and stronger communities.

CHARACTERISTICS OF ATTENDERS

The arts audience is diverse. It includes people from all age groups and income levels and is not limited, as is commonly believed, to older and affluent individuals.

- **Age and Attendance:** The most noteworthy finding from the surveys is the lack of a strong relationship between age and levels of attendance.
- **Household Income and Attendance:** Nonattenders show a trend toward lower incomes and frequent attenders show a trend toward higher incomes. However, the percentage of attenders with moderate household incomes is not greatly different from those in the highest income households.
- **Education and Attendance:** There is a strong relationship between education level and category of attendance. That is, as education level increases, so also does the percentage of respondents who are attenders or frequent attenders.

VALUE OF THE PERFORMING ARTS TO THE INDIVIDUAL

The research indicates clearly that arts attenders place a very high value on the role of the arts in their lives in terms of enjoyment, their understanding of themselves and other cultures, creativity, and connection to their communities. This holds true across age groups, income levels, and the presence of children at home.

- **Offers Enjoyment:** A strong majority of respondents have strong opinions about the level of enjoyment derived from live performing arts. More than three-quarters of respondents strongly agree or agree that the arts are enjoyable.
- **Factors Unrelated to Enjoyment:** Household income, age and the presence of children at home are largely unrelated to the degree to which respondents find live performing arts enjoyable.
- **Impact of Education on Enjoyment:** In four of the five communities, as level of education increases, so does the percentage of respondents who strongly agree that attending live performances is enjoyable.

- **Stimulates Critical Thinking:** In almost all cities, more than three-quarters of respondents also strongly agree or agree that attending live performing arts is thought provoking.
- **Factors Related to Critical Thinking:** The strong belief that the performing arts are thought provoking does not differ substantially by household income level, age, or the presence of children in the home. However, consistent with expectations, this belief is held most commonly by frequent attenders, and least commonly by nonattenders.
- **Increases Cultural Understanding:** Respondents in each of the five communities have similar views regarding the extent to which live performing arts help them understand other cultures better. Overall, between 68 percent (in Cincinnati) and 76 percent (in Alaska) of respondents strongly agree or agree with this statement. This strong level of agreement holds regardless of education, income, age, or whether there are children at home.
- **Encourages Creativity:** Between 58 percent (in Pittsburgh) and 65 percent (in Alaska) of respondents in each community strongly agree or agree that attending live performing arts encourages them to be more creative. One's education level or household income plays little role in whether one feels strongly that attending live performing arts encourages higher levels of creativity.

VALUE OF PERFORMING ARTS TO COMMUNITIES

Attenders place an even greater value on the arts in their communities than they do in their own lives. They believe strongly that the arts *improve the quality of life* and are a *source of community pride, promote understanding of other people and different ways of life, and help preserve and share cultural heritage*. Above all, they believe that the arts *contribute to the education of children*. Especially noteworthy is the fact that a majority of nonattenders share similar views.

- **Individual vs. Community Value:** The percentage of respondents with positive opinions about the value of the arts to their community is even higher than that reported in the preceding section. This suggests that people place a higher value on the arts in their communities than they place on the value of the performing arts in their own lives. Combining both the percentage of respondents who strongly agree and agree with each of these statements, a clear and substantial majority are in agreement, in every community, with every statement in the survey about community value.
- **Value to Children:** More than 9 out of 10 respondents in each of the five communities either strongly agree or agree that the performing arts contribute to the education and development of children. These strong opinions about the contributions made by the performing arts to the education and development children are universally strong, regardless of education level, income, age, presence of children, or frequency of attendance.

- **Increased Quality of Life:** More than 8 out of 10 respondents strongly agree or agree that the performing arts improve the quality of life.
- **Preserves Cultural Heritage:** A strong majority of respondents in each of the five communities strongly agree or agree with the statement that the arts help preserve and share cultural heritage. Among these respondents, the research finds no relationship between this belief and education level, income level, or the presence of children at home.
- **Strengthens Local Economy:** In contrast, respondents are less inclined to value the contribution of the performing arts to the local economy.

BARRIERS TO ATTENDANCE

There are, of course, barriers to arts attendance among nonattenders and barriers to more frequent attendance among those who already attend arts performances. What is particularly interesting is that, despite what some might suspect, the cost of tickets ranks lowest among the three primary barriers.

- **Three Key Barriers:** Of the 11 barriers suggested in the survey, only three are cited by a majority of respondents in the five communities. *Prefer to spend leisure time in other ways* and *hard to make time to go out* are the two most-cited barriers in the various sites. *Cost of tickets* consistently ranks third across the sites.
- **Prefer Spending Time Elsewhere:** About one-third of respondents in each community indicate that their preference to spend leisure time in other ways is a big reason why they do not attend more performing arts events. One of the most notable characteristics of this preference is that it is one of several factors that clearly differentiates attenders from nonattenders in all five communities.
- **Difficulty Finding Time:** Interestingly, attenders and frequent attenders are almost as likely as nonattenders to say that *hard to make time to go out* is a substantial barrier. The one factor that makes this a big factor for more people is the presence or absence of children in the home.
- **Cost of Tickets:** The cost of tickets is the only “big” barrier that attenders cite more often than nonattenders or frequent attenders. Especially noteworthy is the fact that the cost of tickets as a barrier to performing arts attendance is substantially unrelated to education level, age, or whether there are children in the home.

The research makes it clear that attenders and frequent attenders share the same concerns about limited time and the cost of tickets with nonattenders. Yet the first two groups find attendance at the arts sufficiently rewarding to overcome the obstacles. Artists and arts organizations have the challenge of offering performances of sufficient quality, supported by strong customer service and community programs, to help more potential attenders and frequent attenders overcome these barriers.

Other obstacles cited by attenders and nonattenders less often in the surveys also offer arts organizations an opportunity to build audiences by overcoming barriers of perception.

- **Lack of Appeal:** The statement that the *performing arts do not appeal* is cited as a big barrier by between 10 and 14 percent of respondents in the five communities. This barrier is very clearly tied to education level and, as might be expected, clearly differentiates attenders from nonattenders. Performing arts organizations might consider increasing community programs and adult education activities that could help build an interest in the arts among nonattenders.
- **Lack of Comfort:** A number of nonattenders claim they *feel uncomfortable or out of place at performing arts events*, although fewer people cite this as a big barrier and the relationship with education is much weaker in all communities. Performing arts organizations might wish to examine the way audiences are greeted and made to feel welcome upon entering the theater and before performances, during intermissions, and at the conclusion of the event.

Additional barriers, such as *difficulty or cost of getting to or parking at events* are obstacles whose importance varies by community. This particular barrier could be addressed by arts organizations if they are in a position to make special parking arrangements for their audiences. Similarly, the belief that *performances are in unsafe or unfamiliar locations* could be mitigated by improved lighting, more visible security, and general awareness of the needs of the audience beyond the final applause.

Section 1

Introduction

In the spring of 2002, residents of Alaska, Cincinnati, Denver, Pittsburgh, and Seattle responded to a telephone survey designed by the Urban Institute in collaboration with PARC. The questions focused on the values residents place on the performing arts in their communities.

This cross-site report is a companion to individual reports produced for the five communities. Most of the essential statistics and findings from these community reports have been aggregated in this report. *The Value of the Performing Arts in Five Communities* is intended as both a synthesis for national audiences and a way for participating communities to compare their findings with findings in other markets. However, these five communities are not intended to be representative of the entire United States, and we caution readers not to extrapolate findings beyond these five communities.

Local arts organizations in each of the five communities defined the counties or towns that constitute their metropolitan areas. The survey results documented in this report are based on the views of 800 respondents from each of these five geographic areas.

- **The State of Alaska:** Anchorage, Fairbanks, and Juneau (including Douglas Island), the urban centers of the state, which constitute over half of Alaska's population.
- **Cincinnati:** Hamilton, Clermont, Warren, and Butler counties in Ohio; Boone, Kenton, and Campbell counties in Kentucky; and Dearborn County in Indiana.
- **Denver:** Adams, Boulder, Denver, Arapahoe, and Jefferson counties, as well as the Highlands Ranch part of Douglas County.
- **Pittsburgh:** Washington, Westmoreland, Allegheny, Armstrong, Butler, and Beaver counties.
- **Seattle:** King, Snohomish, Pierce, and Kitsap counties.

HOW THE REPORT IS ORGANIZED

The report provides a detailed overview of the level of attendance at and appreciation for the performing arts in each community. It is organized around four key topics:

- **Attendance at Performing Arts Events:** How often do residents attend live performing arts events? Does frequency differ by income, age, education, or the presence of children in the household?
- **Perceived Value of the Performing Arts to Individuals:** What do residents think about the value of the performing arts in their own lives? Do attitudes vary by such characteristics as age and income?
- **Perceived Value of the Performing Arts to the Community:** What are residents' attitudes about the value of the performing arts to the community as a whole? Do attitudes reflect income, education, or age characteristics?
- **Barriers to Participation:** What do residents think are the biggest obstacles to greater attendance at performing arts events?

We provide summary comments where we observe interesting relationships (or see none when we might expect something) but do not attempt to provide comprehensive review of implications or applications of results. Some of these comments incorporate feedback provided by PARC local community working group participants during a series of site visits conducted in each community during the summer of 2002.

In short, the report is heavily oriented toward tabular summaries of data and less oriented toward drawing implications from the relationships in the data. We hope this approach offers stakeholders the detailed information necessary to interpret findings in locally relevant ways.

A statistic called Somer's d is used in a number of tables to show the relationship between two variables. Somer's d values of less than -0.15 or higher than $+0.15$ are worth your attention, while values closer to zero indicate a weak or even nonexistent relationship between variables. For more discussion of Somer's d values, please see page 67 in the section on methodology.

CHARACTERISTICS OF SURVEY RESPONDENTS

Survey respondents in each site generally reflect the diverse education levels, household incomes, ages, and household compositions represented in each of the five communities. This diversity enables us to compare reported attitudes and behaviors of respondents by these characteristics and search for differences across communities.

The following table shows how these major characteristics are distributed among survey respondents.

Respondent education levels, household income, age, and the presence and age of children in the home are central to the tables and commentary that follow in the remaining sections of this report. The distribution of education levels across communities does not differ substantially. However, on the other characteristics, Pittsburgh stands out in comparison to the other four communities, with generally less wealthy, older respondents who are less likely to have children in the home.

Percentage totals in this report may not always add to 100 percent because of rounding. For "children at home," percentage totals always exceed 100 percent because some families have children both under and over 13 years of age.

Section 2

Attendance

Attendance is a common measure of how much people *value* the performing arts. This section focuses on attendance, but it also considers related behaviors such as listening to recorded media, watching performances on public television, and participating personally in performing arts activities.

HIGHLIGHTS

- **Arts Attenders Outnumber Nonattenders:** Approximately two in three residents surveyed in each community attended a live, professional performing arts event in the past 12 months. Between 12 and 18 percent are “frequent attenders,” meaning that they have attended 12 or more such events in the past year.
- **Education and Income Matter:** As educational attainment and household income increase, so does attendance at performing arts events.
- **Age Is Not a Factor:** Age is not clearly associated with attendance in the five communities. Within categories of nonattenders, attenders, and frequent attenders, different age groups are represented in substantially similar numbers.
- **Children at Home Are a Minor Factor:** The presence of children in a household also has less influence on attendance patterns than we anticipated. Respondents in households with young children are roughly as likely as those in households with no children to be nonattenders.
- **Performing Arts Compete Well for People’s Time:** In terms of the number of people who venture into the community to enjoy various leisure activities in a given year, attending the performing arts ranks behind attendance of community festivals and going to the movies, and is on a par with visiting museums or art galleries. A larger percentage of people go to performing arts events than go to clubs or sporting events over the course of a year.

We asked respondents about their attendance at performing arts venues and performances over the past 12 months in each of the five communities. However, rather than simply asking people how many times they may have attended a particular art form or been to a particular place during the past year, we prompted them with specific local organizations for each discipline. By doing this, we hoped to achieve two things. One, we expected that mentioning common organizations and venues by name would assist recall. Two, we felt that giving concrete examples of professional performing arts organizations would clarify the intended scope of such categories as dance or plays and musicals.

For example, in Pittsburgh we asked respondents how many times they had attended ballet or modern/contemporary dance performances at or by the Pittsburgh Ballet Theatre, the Pittsburgh Dance Council, or the Pittsburgh Cultural Trust. However, people also go to dance performances presented or performed by other performing arts organizations, whether in Pittsburgh or elsewhere. So, after presenting several specific examples, we also asked how many times the respondent had attended *other* dance performances at any other place, excluding elementary, middle, or high school productions. We used this same procedure to learn about attendance at opera, theatre, and symphony performances.

The measure of attendance for each discipline consists of the number of performances at both the named and other organizations. We also include a catch-all “other discipline” category. The examples we gave to respondents for this “other discipline” category were chamber music, jazz, folk music, or traditional arts and festivals, but we expect that the category includes the full range of performing arts activities that respondents could not group under dance, opera, theatre, or symphony.

TABLE 2.1

RESPONDENTS ATTENDING AT LEAST ONE PERFORMING ARTS EVENT IN THE PAST 12 MONTHS, BY DISCIPLINE					
Discipline	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
Dance	36%	24%	28%	23%	33%
Opera	11%	7%	8%	7%	10%
Theatre	46%	46%	51%	42%	46%

Other	38%	22%	34%	33%	35%
Any	69%	62%	67%	61%	67%

Source: Urban Institute Analysis of PARC Household Data, 2002.

Consistently across all five communities, theatre is the most commonly attended performing arts form. Dance and “other” performing arts vie for second place, followed by symphony and opera. Some members of community working groups felt that various numbers seemed high. For example, some in the Pittsburgh working group felt strongly that an estimate of 23 percent was too high for dance attenders in their metropolitan area. On the other hand, the Seattle working group felt that an estimate of 33 percent of dance attenders in their community was good. “Seattle is known for its dance attendance,” they said.

The attendance numbers reported here are generally higher than those reported over the past 20 years in Surveys of Public Participation in the Arts (SPPA), a study commissioned by the National Endowment for the Arts. Classical music attendance was reported at 13 percent in 1992 and 16 percent in 1997. Opera attendance was reported at 3 percent in 1985 and 5 percent in 1997. Musical and non-musical plays are reported separately in the SPPA, as are ballet and other dance, but all indicate generally much lower levels of attendance than we report here.

One reason for this discrepancy may be that the data collection efforts occurred in major urban areas, where these five performing arts disciplines are actively represented. The SPPA surveyed respondents across the United States, including rural areas and small towns where opportunities to attend performing arts events are limited. We would expect that performing arts attendance by people in major metropolitan areas would be higher than in less densely populated areas where opera, symphony, dance, and a variety of theatrical performances simply are not available. Further, our method of prompting respondents by naming specific organizations also may have resulted in a greater amount of recall than the method used by the SPPA.

The last row reports the percentage of respondents who said that they had been to any live, professional performing arts event in the past 12 months. These numbers range from 69 percent (in Alaska) to 61 percent (in Pittsburgh), leaving between 31 and 39 percent of respondents who say that they have been to no performing arts performances in the past 12 months. We label these people “nonattenders” and include them in the first row of table 2.2.

TABLE 2.2

FREQUENCY OF ATTENDANCE AT LIVE PERFORMING ARTS EVENTS IN THE PAST 12 MONTHS					
Attendance Level	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
Nonattender (0 events)	31%	38%	33%	39%	33%
Attender (1-11 events)	52%	50%	49%	46%	51%
Frequent attender (12 or more events)	17%	12%	18%	15%	16%

Source: Urban Institute Analysis of PARC Household Data, 2002.

We divided survey respondents into three groups: nonattenders, attenders, and frequent attenders. Attenders are those respondents who have been to 11 or fewer performances in the past year—an average of less than one performance a month. Frequent attenders are those respondents who have been to 12 or more performances in the past year.

The choice of making the break between 11 and 12 performances is based on the search for a reasonable division between attenders and frequent attenders. Nonetheless, we have heard a variety of opinions about where this break should be. The decision to focus on only three categories comes from the arts participation literature that refers to three categories of attenders. However, our meetings with community working groups clearly indicate that more categories would provide useful distinctions for performing arts managers. At a minimum, future research should consider differentiating between people who attend two or three performances a year and those who attend more frequently.

The distinctions among these attendance levels are important because we expect that the way people feel about the performing arts and about factors that keep them from attending performances more often will be related to their frequency of attendance. Thus, in the remainder of this section and in the sections to come, we report differences among these three categories.

TABLE 2.3

FREQUENCY OF ATTENDANCE AT LIVE PERFORMING ARTS EVENTS IN THE PAST 12 MONTHS, BY EDUCATION

	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
NONATTENDERS					
Elementary school	57%	64%	77%	76%	57%
High school or GED	52%	55%	47%	55%	57%
Junior college or tech school	29%	33%	31%	35%	33%
Four-year college or university	21%	22%	23%	26%	19%
Postgraduate	6%	19%	13%	10%	16%
ATTENDERS					
Elementary school	41%	37%	20%	19%	37%

Elementary school	3%	0%	3%	5%	7%
High school or GED	8%	7%	12%	7%	4%
Junior college or tech school	15%	11%	17%	12%	15%
Four-year college or university	20%	16%	21%	22%	21%
Postgraduate	41%	24%	25%	37%	32%
Somer's d	+0.28	+0.26	+0.24	+0.31	+0.27

Source: Urban Institute Analysis of PARC Household Data, 2002.

Respondents with more education attend live performing arts events more often. As education level increases, so also does the percentage of respondents who fall into attender or frequent attender categories of attendance. This finding is also substantiated by the Somer's d values shown in the table above. In all five communities, the Somer's d for the relationship between education level and arts attendance is considerably greater than +0.15.

As described briefly on page 13 and in more detail on page 67 at the end of the report, a measure of association called Somer's d can give us an indication of the strength of the relationship between two variables. The value of Somer's d for education level and the three categories of attendance range from +0.24 to +0.31. The positive sign tells us that there is an overall association between higher education level and higher level of attendance in the performing arts. The magnitude of these statistics is worth paying attention to because they exceed our guideline of 0.15 and above for noting the presence of a relationship between two variables. Thus, we conclude that education level is positively associated with attendance level.

TABLE 2.4

**FREQUENCY OF ATTENDANCE AT PERFORMING ARTS EVENTS IN THE PAST 12 MONTHS,
BY HOUSEHOLD INCOME**

	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
NONATTENDERS					
Less than \$25,000	47%	53%	51%	57%	48%

\$100,000 or more	22%	24%	29%	26%	25%
Somer's d	+0.17	+0.20	+0.18	+0.26	+0.15

Source: Urban Institute Analysis of PARC Household Data, 2002.

Not surprisingly, the relationship between household income and performing arts attendance is nearly as strong as the relationship between education level and performing arts attendance. Nonattenders clearly show a trend toward lower incomes, while frequent attenders exhibit a trend toward higher incomes. The high value for Somer's d in all communities also points to the strength of the relationship between attendance and household income. Nonetheless, higher levels of attendance are not simply a matter of higher levels of income. The percentage of attenders with household incomes between \$50,000 and \$100,000 is not greatly different from that of those with annual incomes above \$100,000.

In contrast to education level and household income, age is not strongly related to attendance levels. This finding is interesting because popular discussions often assume that performing arts audiences are mostly composed of older people—a “graying” of attenders. Our findings, however, indicate that the 65 and over age category is the one with the greatest percentage of nonattenders. In most communities we observe only small percentage differences among attenders age 25 to 54. In fairness to the “graying” thesis, the greatest percentage of frequent attenders is generally found among those age 55-64. However, respondents in this age cohort are only a little less likely to be nonattenders than are younger respondents.

TABLE 2.6

FREQUENCY OF ATTENDANCE AT LIVE PERFORMING ARTS EVENTS IN THE PAST 12 MONTHS, BY CHILDREN AT HOME

	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
NONATTENDERS					
No children at home	31%	41%	31%	39%	31%
Children under 13 years of age	35%	36%	39%	45%	40%

Children 13 years of age and older	17%	12%	17%	6%	17%

Source: Urban Institute Analysis of PARC Household Data, 2002.

We might expect to find that children, especially young children, are an inhibitor to attending performing arts events. While respondents in households with young children represent the greatest number of nonattenders in four of five communities, the differences among categories are not pronounced. Indeed, in Cincinnati, the greatest percentage of nonattenders is found among those respondents with *no* children at home.

The idea that children keep their parents from getting out to more performing arts events gains slightly more support when considering only the frequent attenders. Frequent attendance of performing arts events is a more common characteristic of respondents in households with no children at home. However, there is only a marginal difference between these households and households with older children. Young children appear to be an inhibitor to frequent attendance, but certainly do not rule out frequent attendance altogether.

TABLE 2.7

PERSONAL INVOLVEMENT IN OTHER ARTS-RELATED ACTIVITIES

Activity	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
Listen to classical music on radio, tape, or CD	68%	57%	66%	54%	65%
Watch performing arts on television	70%	65%	70%	66%	71%
Play musical instrument	27%	26%	25%	19%	27%
Sing in a choir or singing group	17%	17%	13%	14%	16%
Perform or produce performing arts	22%	22%	18%	18%	21%

Source: Urban Institute Analysis of PARC Household Data, 2002.

More than half of all respondents also enjoy the performing arts by listening to recorded music or watching televised events. The majority of respondents say they have listened to classical music in the past year, a much higher number than those who went to a live classical musical performance. Even more respondents say they have watched the performing arts on television in the past year.

While community working groups acknowledged that people are likely to listen occasionally to classical music on the radio, they felt that the television numbers were artificially high. “What do these people think they’re watching?” asked one working group participant. “Watching dance or opera on television is *boring*,” she continued. “Why would someone who never comes to a live event choose to watch a performing arts event on television?”

The percentage of respondents who say they have been actively involved in playing an instrument, singing, or performing/producing a performing arts event is somewhat lower. Nonetheless, this points to a substantial minority of the population in our five communities who directly make the performing arts part of their personal lives.

TABLE 2.8

RESPONDENTS PARTICIPATING IN OTHER LEISURE ACTIVITIES OVER THE PAST 12 MONTHS

Leisure Activity	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
Attend a community festival, parade, etc.	81%	79%	75%	82%	78%
Go to movies	86%	78%	84%	73%	85%
Go to museum or art gallery	68%	58%	70%	51%	70%

Attend amateur sporting event	42%	46%	37%	39%	36%
Attend live pop/rock concert	26%	36%	39%	32%	35%
Attend live comedy show	24%	21%	28%	18%	24%
Percent who attended any live performing arts event in the past 12 months (from table 2.1)	69%	62%	67%	61%	67%

Source: Urban Institute Analysis of PARC Household Data, 2002.

This table considers how the performing arts compete with other activities. In all five communities, more people have attended a live performing arts event at least once in the past year than have attended a professional sporting event. Only attendance at community festivals and going to the movies are common to more people than attendance at live performing arts. In three of five communities, attending the performing arts is even more common than going to a museum or art gallery.

In the individual community reports, we offer findings on the relationship between attendance at performing arts events and the average number of times respondents participated in other leisure activities. The findings are too complex to illustrate in a cross-site table, but the basic trends are clear. To wit, frequent performing arts attenders are also the most frequent attenders of other leisure activities, including sporting events, movies, festivals, museums, and popular concerts. Attenders are generally more involved with these activities than nonattenders of performing arts events. This finding points to the overlap in performing arts attendance and involvement in other community activities. Rather than an “arts” versus “other activities” distinction, the finding suggests that people generally are either involved in community activities (be it attendance at performing arts activities or otherwise) or they are not.

Section 3

Value to the Individual

As reported in the previous section, between 31 and 39 percent of respondents in the five communities had not gone to a live performing arts event in the past 12 months. However, 54 to 71 percent report that they had either listened to classical music or watched performing arts on television. This finding suggests that some people enjoy or value the performing arts even if they do not go to live events. In this section we focus on a series of questions designed to capture information about perceptions of the value of the performing arts to individuals.

HIGHLIGHTS

- **Positive Attitudes Dominate:** Overall, respondents in each of the five communities share uniformly high opinions about the contribution of the performing arts to their lives. We generally find this to be true regardless of education, income, age, or the presence of children at home. Two exceptions are noted regarding the relationship between education and the extent to which respondents find performing arts *enjoyable* (table 3.2) and *thought provoking* (table 3.3). In both cases, more educated respondents are more likely to strongly agree with each of these sentiments than their less educated counterparts.
- **Attendance is Linked to Positive Attitudes:** As attendance increases so does agreement with the perceived value of the performing arts to individuals. Frequent attenders of the arts are considerably more likely to strongly agree with each of the personal attitudes considered in this study. One exception is noted in table 3.5 where frequent attenders are not necessarily inclined to agree that attending live performing arts is *primarily a social occasion*.

TABLE 3.1

page 27

Overall Value to Individual. Most respondents have positive attitudes about the value of performing arts in their lives. Between 54 and 85 percent of respondents either strongly agree or somewhat agree with each statement. We conclude that households in each of the five communities participating in this study generally have high regard for the value of the performing arts.

With few exceptions, a third or more of respondents in each community also strongly agree that attending live performing arts is *thought provoking*, *helps to understand other cultures better*, and is *primarily a social occasion*.

In tables 3.2 through 3.7, we consider whether any of these individual values are differentiated by education, income, age, presence of children in the household, or frequency of attendance at live performing arts events. In these remaining tables we focus only on the percentage of respondents who strongly agree with each statement.

TABLE 3.2

page 28

Provides Enjoyment. In four of the five communities, as level of education increases so does the percentage of respondents who strongly agree with the statement that *attending live performing arts is enjoyable*. In Denver, this overall trend is supported even though slightly more of those who completed elementary school strongly agree that the performing arts are enjoyable (48 percent) than do those who completed high school (45 percent). There is a noticeable degree of variation across communities with regard to the percentage of those who completed elementary school who strongly agree that the performing arts are *enjoyable*—20 percent in Pittsburgh compared with 48 percent in Denver.

Household income, age, and presence of children at home are largely unrelated to the degree to which respondents find live performing arts to be enjoyable. Alaska is an exception, where older respondents (up to the age of 64) report increasingly high levels of agreement regarding enjoyment of the performing arts.

As might be expected, the most frequent attenders derive more enjoyment than less frequent attenders. Similarly, attenders are roughly twice as likely as nonattenders to strongly agree that live performing arts are enjoyable. This raises a question of whether lack of enjoyment by some is a *reason* they do not attend the performing arts. We return to this question in the section on barriers to attendance.

TABLE 3.3

page 29

Stimulates Critical Thinking. Respondents with more education are more likely to feel that the performing arts are *thought provoking*. Although patterns are clearly present in the data, the strength of this relationship is somewhat weaker than the relationship between education and enjoyment of performing arts (previous table).

The strong belief that the performing arts are thought provoking does not differ substantially by household income levels, age, or the presence of children in the home. However, consistent with our expectations, this belief is held most commonly by frequent attenders, and least commonly by nonattenders.

**TABLE 3.4**

page 30

Increases Cultural Understanding. Respondents in each of the five communities share similar views regarding the extent to which live performing arts help them to *understand other cultures better*. Overall, between 31 and 38 percent of respondents strongly agree with this statement. This strong level of agreement holds regardless of education, income, age, or whether or not there are children at home. Moreover, at least half of frequent attenders in all five communities agree. Unlike the previous two statements, however, there is not a substantial gap between attenders and nonattenders regarding the belief that the arts contribute to cultural understanding.

TABLE 3.5

page 31

Offers Opportunity to Socialize. The literature on arts participation suggests that the most frequent attenders derive different benefits from their arts experience than do less frequent or nonattenders. So, while a more casual arts attender might be motivated to go to an event mostly for social reasons, the more frequent attender might be motivated more by a deeper appreciation for the arts experience or a particular artist. Thus, the use of the word “primarily” in this question was intended to identify the percentage of respondents who feel that attending live performing arts events is mostly a social occasion, rather than some other kind of experience.

This idea gains most support in Alaska where equal numbers of frequent attenders and nonattenders strongly agree that the arts are primarily a social occasion. In Denver, Pittsburgh, and Seattle, the percentages are largely undifferentiated among frequent attenders and attenders. Thus, it seems that frequent attenders in four of the five communities value the performing arts for reasons other than social value.

TABLE 3.6

page 32

Inspires Personal Creativity. Between a quarter and one-third of respondents in each community strongly agree that attending live performing arts events *makes them feel more creative*. In all communities except Alaska, there is a negative association between creativity and age. That is, younger respondents are more inclined to strongly agree than are older respondents that attending live performing arts events encourages them to be more creative.

On the other hand, education level and household income play little role in whether a respondent feels strongly that *attending live performing arts encourages more creativity*. Frequent attenders are most likely to agree, although less than half of the respondents in this category strongly agree with the personal creative value of the arts.

TABLE 3.7

page 33

Increases Connection to the Community. Among all the personal values considered, the perception that attending live performing arts *makes people feel more connected to their community* received the lowest levels of agreement. Overall, only about one in five respondents strongly agree with this statement. The percentages in the table provide a small amount of evidence to suggest that respondents from lower income households and older individuals are slightly more likely to agree strongly that performing arts increase their feelings of connectedness.

Again, frequent attenders are most likely to strongly agree that attending live performing arts makes them feel more connected to their community. However, a little more than one in three frequent attenders voice strong agreement with this statement.

Section 4

Value to the Community

In this section we continue to explore public perceptions about the value of live performing arts, but shift our focus to specific ways in which live performing arts are believed to contribute to or affect community life. As in the preceding section, respondents were asked to consider a series of value statements and report the extent to which they agreed or disagreed with each.

HIGHLIGHTS

- ***Value to the Community is Higher than Value to the Individual:*** Household respondents in each of the five communities place an even higher value on the arts in their communities than in their own lives. Even nonattenders place a high value on the arts in their communities. As expected, frequent attenders are more likely to agree than attenders, and attenders are more likely to agree than nonattenders.
- ***People Believe Arts Matter for Children:*** Overall, about two in three respondents in each of the five communities strongly agree that the performing arts contribute to the education and development of children. These very high opinions are borne out regardless of education, age, income, or presence of children in the household.
- ***Attendance Related to Giving and Volunteering:*** Attendance at performing arts events is closely related to both volunteerism and inclination to make a financial contribution to an arts organization. These relationships are two of the strongest found in the study.

TABLE 4.1

page 38

Overall Contributions to the Community. The percentage of respondents with positive opinions about the contributions made by performing arts to their community is considerably higher than percentages reported in the preceding section. This finding leads us to conclude that people place a higher value on the arts in their communities than they place on the value of the performing arts in their own lives.

For example, while two-thirds of respondents strongly agree that the performing arts contribute to the education and development of children, we also found that more than 9 out of 10 respondents in each of the five communities either strongly agree or agree with this statement. Subsequent tables consider whether these opinions can be differentiated by education level, income, age, children at home, or frequency of attendance. In general, we conclude that these strong opinions about the contributions made by the performing arts to the education and development of children are universally evident.

In contrast, respondents feel less positively about the contribution of performing arts to the local economy. These results suggest either that the general public is not familiar with the economic impact of the arts in their community or that, relative to other industries, they believe the arts are simply not a major contributor.

TABLE 4.2

page 39

Improves Quality of Life. A majority of respondents in all communities except Cincinnati strongly agree that performing arts *improve the quality of life in their community*. Not surprisingly, more highly educated respondents are more inclined to agree than less educated respondents. This relationship is seen both in the ascending percentages by education level as well as in Somer's *d* values in the range of +0.13 to +0.21. Although the Somer's *d* values for household income are about one-third to half the levels reported for education, there is some evidence to suggest that opinions about quality of life are related to income. This trend is most clearly observed in Alaska, Cincinnati, and Pittsburgh.

Age is a factor affecting how people view the contribution of arts to *community quality of life*, particularly for the youngest respondents. Although there is considerable uniformity among percentages for respondents age 35 or more, large differences are observed between respondents age 25 or less and those age 35 or more.

As expected, very high proportions of frequent attenders strongly agree that the performing arts *improve a community's quality of life*—9 out of 10 in Seattle, and 8 out of 10 in all other communities. More interesting, perhaps, is that roughly one in three nonattenders also strongly agree.

TABLE 4.3

TABLE 4.4

page 40

page 41

Promotes Understanding of Others and Opportunity to Socialize. Summary statistics are reported for the statements *promote understanding of other people and different ways of life* in table 4.3 and *provide opportunities to socialize with other people* in table 4.4. With the exception of Denver, respondents in each community were slightly more likely to agree that performing arts *provide opportunities to socialize with others* than performing arts *promote understanding of others*. Overall, these opinions do not appear to be influenced by income, age, or presence of children at home. Table 4.3 shows some modest patterns in the percentages that suggest that respondents with higher levels of education are more inclined to think that the arts *promote understanding of others*, particularly in Cincinnati, Denver, and Pittsburgh.

**TABLE 4.5**

page 42

Fosters Pride in the Community. Communities exhibit some interesting variations in respondents' views on whether they feel the performing arts are a *source of pride* for their community. In Pittsburgh, more highly educated people are likely to say that the arts are a *source of pride* in their community. In Alaska and Denver, older people are more likely to feel this way. In Alaska, Cincinnati, and Denver higher percentages of respondents with children over the age of 13 strongly agree that performing arts are a *source of pride* compared with those with children under the age of 13 or those with no children at home.

TABLE 4.6

page 43

Contributes to Education and Development of Children. About two-thirds of all respondents strongly agree that the performing arts *contribute to the education and development of children*. The *contribution of the performing arts to the education and development of children* is the most highly regarded value among respondents in this study. These high opinions are undifferentiated by education, income, age, or presence of children at home.

TABLE 4.7

page 44

Supports Lifelong Learning for Adults. In the previous table, we reported that about two-thirds of respondents in each community strongly agreed that the arts contribute to the education and development of children. In contrast, only about half of respondents strongly agree that the arts *contribute to lifelong learning for adults*.

TABLE 4.8

page 45

Preserves Cultural Heritage. A majority of respondents in each of the five communities strongly agree that the performing arts *help preserve and share cultural heritage*. The only other community value where more than half of the respondents in each community strongly agree is the value of the performing arts to *the education and development of children*. However, we find no relationship between respondents' perception that the performing arts *help preserve and share cultural heritage* and their education, income, age, or whether they have children at home.

TABLE 4.9

page 46

Benefits Local Economy. The percentage of respondents who strongly agree that the performing arts *contribute to the local economy* is considerably lower than other community values considered in this study. Interestingly, only 32 percent of Alaskans strongly agree with this statement, which is 15 to 34 percentage points lower than any other community value rated by Alaskans.

A weak to moderate relationship is found between age and *contribution to the local economy*. In Denver and Cincinnati, we note a trend suggesting that older people are more inclined to see a positive link between performing arts and the local economy.

Among the eight community values considered, we found that education was most strongly related to perceptions about *quality of life* (table 4.2), and to a lesser degree also related to *promote understanding of others* (table 4.3) and *contribute to lifelong learning of adults* (table 4.7). Age appears to be somewhat related to perceptions about *quality of life* (table 4.2), *source of pride* (table 4.4), and *contribution to the local economy* (table 4.9). Income was not substantially related to any of the values considered in this section.

Performing arts organizations are interested in understanding how and to what extent *volunteerism* and *willingness to make a financial contribution* to an arts organization are related to arts attendance. Tables 4.10 and 4.11 present our findings on these topics.

TABLE 4.10**page 47**

Volunteering in Community. We asked respondents how often they *volunteer in their community* for charity, school, religious congregation, or community activities. In all five communities, arts attenders and frequent arts attenders are considerably more likely to volunteer (even if only occasionally) than nonattenders. Although there is clear evidence to support this relationship, the data cannot be used to suggest that attendance at performing arts results in higher levels of volunteerism. Rather, these findings are consistent with our earlier observations that arts attenders are simply more active in the community than nonattenders.

TABLE 4.11**page 47**

Contributing Financially to Arts Organization. Not surprisingly, frequent attenders were substantially more likely to have *made a financial contribution to an arts organization*. Perhaps more interesting is the percentage of frequent attenders who did *not* make such a contribution. In Denver and Pittsburgh, less than half of frequent attenders supplemented their ticket purchases with a financial contribution to an arts organization.

TABLE 4.1

ATTITUDES TOWARD THE PERSONAL VALUE OF THE PERFORMING ARTS

Performing Arts...	...improve the quality of life in the community	...promote understanding of others and different ways of life	...provide opportunities to socialize with other people	...are a source of pride for those in the community	...contribute to the education and development of children	...contribute to lifelong learning for adults	...help preserve and share cultural heritage	...contribute to the economy of the greater community

Section 5

Barriers to Attendance

In each community, we asked a series of questions designed to measure the extent to which different factors get in the way of attending the performing arts more frequently. For nonattenders, the question can be taken to mean “Why don’t you attend?” For attenders, the question can be taken to mean “What keeps you from attending even more?”

We asked respondents whether a particular issue was a big reason, a moderate reason, a small reason, or not a reason why they do not attend the performing arts more often. All of the tables in this section focus exclusively on the percentage of respondents who cite a particular barrier as a “big reason.”

HIGHLIGHTS

- **Three Primary Obstacles:** The three most often cited barriers to attendance at performing arts performances are *prefer to spend leisure time in other ways*, *hard to make time to go out*, and *cost of tickets*.
- **Different People Face Different Barriers:** Respondents with lower levels of education are more likely to claim that the *performing arts do not appeal* to them. Respondents from lower income families are likely to cite *cost of tickets* as a substantial barrier. Younger people note family obligations, as well as the *lack of publicity or information about performing events or times*. Respondents with children are more likely to cite *family obligations*, while respondents without children say they have *no one to attend with*. However, most barriers are not clearly associated with these respondent characteristics.
- **Nonattenders Have Many Excuses:** Nonattenders are more likely than attenders to say that they *prefer to spend leisure time in other ways*, or that the *performing arts do not appeal* to them. Except in Alaska, nonattenders are also more likely to say that they have *no one to attend with* or that they *feel uncomfortable or out of place at performing arts events*. With the exception of Seattle, attenders are more likely to say that the *cost of tickets is too high*, differentiating them from nonattenders and frequent attenders. In Seattle, nonattenders are more likely than attenders and frequent attenders to say that it is *hard to make time to go out*.

TABLE 5.1

page 52

Most Frequently Cited Barriers. Only three of these barriers are cited by a majority of respondents in the five communities. *Prefer to spend leisure time in other ways* and *hard to make time to go out* rank as the two most-cited barriers in these communities. *Cost of tickets* consistently ranks third overall. These general conclusions, however, mask a good deal of variation by household income level, the presence or absence of children in the household, and performing arts attendance levels. In the remaining tables in this section, we consider each barrier and its association with relevant respondent characteristics.

TABLE 5.2

page 53

Cost of Tickets. We draw three conclusions about *cost of tickets*. First, as might be expected, the cost barrier is associated with household income level. In short, households with lower levels of income are more likely to cite *cost of tickets* as a barrier to greater attendance. This relationship is strongest in Denver and weakest in Cincinnati, where Somer's d only reaches a value of -0.10 .

Second, the tendency to claim *cost of tickets* as a barrier to performing arts attendance is substantially unrelated to education level, age, or whether there are children in the home. The highest value of Somer's d for education or age and its relationship with *cost of tickets* is $+0.08$ in Alaska. Oddly, the positive sign indicates that respondents with *more* education (who are also those respondents who tend to have higher incomes) are slightly more likely to cite ticket prices as a barrier than their less educated counterparts. While the low level of Somer's d implies a weak relationship here, we nonetheless suspect a complicated association among income, education, and the attitude toward *cost of tickets* in explaining attendance at performing arts events.

Third, *cost of tickets* is the *only* big barrier that attenders cite more often than nonattenders or frequent attenders. This generalization is not true in Seattle, where the percentages for each attender category are virtually equal, but it is a clear finding in Cincinnati and notable in the other three communities as well.

TABLE 5.3

page 54

Family Obligations. Responses to the *family obligations* barrier do not vary by education level or household income level. However, responses do vary considerably by age, with respondents age 25-44 most likely to cite *family obligations* as a big barrier to performing arts attendance. Since the youngest respondents (those under 25 years) are a bit less likely to note *family obligations* as a barrier, one might surmise that this barrier is mostly an issue for respondents who are starting their own families. This hypothesis is supported by the very high differences between people with no children and those with young children in their home. Very few people with no children cite *family obligations* as a big barrier. On the other hand, as many as half of respondents with young children at home say that *family obligations* keep them from going to performing arts events. For some, this translates into nonattendance. Nonattenders cite *family obligations* as a big barrier more often than do attenders and frequent attenders.

**TABLE 5.4**

page 55

Difficulty or Cost of Getting to or Parking at Events. We observe interesting variations among different communities regarding *difficulty or cost of getting to or parking at events*.

This issue is clearly a problem in Seattle, where more than twice as many respondents cite transportation and parking as a barrier than do respondents in Alaska. While one might hypothesize that lower income households would consistently rate this cost item as a significant barrier, Pittsburgh is the only community where this hypothesis bears out.

The oldest group of respondents is more likely to cite *difficulty or cost of getting to or parking at events* as a big issue than those respondents under 65 years of age. However, the low Somer's *d* values indicate that there is not a linear relationship between the two variables.

TABLE 5.5

page 56

Unsafe or Unfamiliar Event Locations. This table reports relatively weak relationships between the feeling that *performances are in unsafe or unfamiliar locations* and demographic characteristics.

However, we see some trends for those citing this factor as a big reason why they do not attend performing arts events more often. In most communities, respondents who are less educated, least wealthy, and older are most likely to note *unsafe or unfamiliar locations* as a substantial deterrent to attendance. Denver and Seattle are notable because more than twice as many nonattenders cite this factor as a barrier than attenders. This suggests that the issue is substantial enough to keep some people away who otherwise might be inclined to attend performing arts events.

TABLE 5.6

page 57

Insufficient Publicity or Information about Events. While *not enough publicity or information about performing events or times* is more of a complaint among the less wealthy households in Alaska and Seattle, the data indicate that the clearest association is with the various age categories. Younger respondents are more likely to cite lack of publicity or information as an important reason why they do not attend more frequently.

TABLE 5.7

page 58

Prefer Spending Leisure Time in Other Ways. About one-third of respondents in each community indicate that their *preference to spend leisure time in other ways* is a big reason they do not attend more performing arts events. As noted earlier, it is one of three factors that a majority of respondents in all five communities cited as either a big, moderate, or small reason why they do not attend more often. In Alaska and Denver, we observe a pattern in which respondents with lower levels of education are much more likely to say that they prefer to do other things. In Cincinnati, the effect is much less clear, with respondents at all education levels responding in much the same way. One of the most notable characteristics of the *preference to spend leisure time in other ways* statement is that it is one of several factors that clearly differentiates attenders from nonattenders in all five communities.

TABLE 5.8

page 47

Hard to Make Time to Go Out. The claim that it is *hard to make time to go out* is the third of three factors cited by a majority of respondents in all five communities as a barrier to attendance. In three of five communities, it is the most-cited *big* reason why people do not attend the performing arts more frequently. Overall, attenders and frequent attenders are almost

as likely as nonattenders to say that *hard to make time to go out* is a substantial barrier. The one factor that makes this a big barrier for more people is the presence or absence of children in the home. Whether the children are younger or older, respondents in households with children are much more likely to say that *time* keeps them from the performing arts.

TABLE 5.9

page 60

No One with Whom to Attend Event. Not having anyone to attend with is *not* cited as a big reason for a large number of respondents, but it is clearly a greater problem for respondents from lower income families. In Pittsburgh and Cincinnati, there is a clear relationship between income level and the claim that *no one to attend with* is a barrier to attendance. The finding is nearly as strong in Denver and Seattle, but much less clear in Alaska. Also, again with Alaska as an exception, this barrier differentiates nonattenders from attenders, with nonattenders claiming in larger numbers that *no one to attend with* keeps them from getting out to the performing arts. We also observe that the tendency to claim *no one to attend with* as a barrier is associated with respondents who have no children at home.

TABLE 5.10

page 61

Lack of Appeal. The final three barriers to attendance are sometimes referred to as *perceptual* barriers. The first, *performing arts do not appeal*, is cited as a big barrier by 10 to 14 percent of respondents in the five communities. This barrier is clearly tied to education level. Respondents with higher levels of education are decreasingly likely to cite *no appeal* as a reason why they do not attend the performing arts more than they do. Although the relationship with age is not linear as it is with education level, the youngest respondents are much more likely to cite *no appeal* as a barrier. Also, as might be expected, *performing arts do not appeal* differentiates the attenders from the nonattenders. While a few attenders (and even a few frequent attenders) say that they do not attend more because they do not find the performing arts greatly appealing, approximately a quarter of nonattenders say they do not go because of the lack of appeal.

TABLE 5.11

page 62

Feeling Uncomfortable or Out of Place. A second perceptual barrier is *feeling uncomfortable or out of place* at performing arts events. The characteristics of this barrier are similar to the characteristics of *performing arts do not appeal*, although fewer people overall cite it as a big barrier and the relationship with education is much weaker in all communities. However, as with *performing arts do not appeal*, the statement *feel uncomfortable or out of place* is a claim that differentiates the nonattenders from the attenders.

TABLE 5.12

page 63

Past Performances Have Not Been Enjoyable. A third perceptual barrier captures the experiences of individuals who *have not enjoyed past performances*. Overall, *have not enjoyed past performances* is not a big reason why people do not attend the performing arts.

Section 6

Methodology

COMMUNITY SELECTION CONSIDERATIONS

The communities were carefully selected, looking for the following characteristics that were deemed important to the success of the project:

- Representation of three or more of the five disciplines encompassed by the participating national service organizations.
- Financially and managerially strong local arts organizations.
- Established and strong working relationships between local arts organizations and their national service organizations.
- Willingness and ability of the local arts organizations to work as part of a working group.
- Established capacity for collecting data on the part of local arts organizations.
- Willingness on the part of the local arts organizations to administer the surveys developed by the Performing Arts Research Coalition.
- Presence of supplemental funding sources in the community that could be involved in sustaining this research in the future.
- Geographic diversity and a variety of community sizes.

LOCAL WORKING GROUP RESPONSIBILITIES

The working group of performing arts organizations in each of the communities had six primary project responsibilities: (1) To participate in the design of survey instruments; (2) To collect data from their audiences and subscribers; (3) To use the audience, subscriber, and household data to design concrete strategies for improving the management of their organizations; (4) To use the audience, subscriber, and household data to make an impact on the role the arts play in their community; (5) To provide feedback on or write sections of project reports; (6) To consider ways to maintain local data collection efforts after the completion of the PARC project.

PARC DATA SOURCES

The PARC research framework relies on four data sources to contribute information toward a more comprehensive understanding of the performing arts. Following is a description of the four sources and the type of information they provide.

Administrative Surveys: Each of the participating national service organizations conducted annual surveys of its members, collecting extensive administrative data. Most provided information on the numbers and types of performances, attendance, and a range of financial information, including sources of revenue and types of expenses. Selected items (or their definitions) from the existing surveys have been reviewed and some new items have been added so that key data elements can be captured consistently across all the disciplines.

Audience Surveys: Audience surveys provided information on audience demographics, feedback on customer satisfaction and perceived performance quality, and some feedback on audience perceptions of the value of the performing arts. Audience surveys were administered by each of the participating arts organizations in each of the study sites. Two-page surveys were placed on seats in performance venues or handed to audience members in conjunction with performances according to specific procedures established by the Urban Institute.

Subscriber Surveys: As with the audience surveys, the subscriber surveys provided information on demographics and feedback on customer satisfaction and perceived performance quality. The subscriber survey contained expanded questions about the perceptions of the value of the performing arts to respondents, their families, and their communities. Participating arts organizations in each study site mailed the six-page survey to a randomly selected group of subscribers according to procedures established by the Urban Institute.

Household Surveys: Household surveys, conducted by telephone, collected information to help understand the attitudes of people who attend, or do not attend the performing arts regularly, and to further understand why and how individuals can be motivated to become participants. The telephone surveys of random households in each participating community were conducted by Princeton Survey Research Associates according to procedures developed by the Urban Institute.

A Note about This Report

This report is based only on an analysis of the responses from the household surveys described above. Findings from the administrative surveys will be issued in a separate report. Data from the audience and subscriber surveys have been provided to the participating local arts organizations. Further analysis of these data is in the hands of local arts organizations and working groups.

HOW THE HOUSEHOLD TELEPHONE SURVEYS WERE CONDUCTED

Survey respondents were selected using random digit dialing. Every active block of telephone numbers (area code + exchange + two-digit block number) was included in the predefined geographic areas. A computer randomly generated the final two digits of randomly selected blocks. Resulting numbers that matched listings in business directories were purged from the list. Calls were conducted by Princeton Survey Research Associates in late winter and early spring of 2002.

Table 6.1 provides contact, cooperation, and completion numbers for all five communities. Randomly generated numbers result in a large number of nonworking numbers. The number of working numbers contacted ranged from nearly 2,600 in Pittsburgh to just over 1,800 in Alaska. The substantially higher number of contacts in Pittsburgh was due mainly to the higher proportion of refusals there. Nearly 60 percent of households contacted in Pittsburgh refused to participate, compared with roughly 35 percent in Alaska.

The overall response rate in each community is a function of successful contacts, degree of cooperation, and the ability to complete interviews once they are started. Response rates range from a high of 47 percent in Alaska to a low of 32 percent in Pittsburgh. Despite its reputation as a heavily telemarketed area, Cincinnati achieved the second highest response rate at 37 percent.

While these response rates are not out of line with other studies of this type, they do raise questions of nonresponse bias. That is, one might suspect that people who could not be contacted, would not cooperate with the interview, or did not complete it once started might have responded differently from people who completed the interview. If so, and if the differences are relevant to issues under investigation in the study, then one cannot make reliable inferences from a sample to the population of a given metropolitan area.

TABLE 6.1

CONTACT, COOPERATION, COMPLETION AND RESPONSE RATES					
	Alaska	Cincinnati	Denver	Pittsburgh	Seattle
dialed numbers	3,780	3,610	4,657	3,603	4,103
non-working numbers	-1,977	-1,301	-2,157	-1,010	-1,689
working numbers	1,803	2,309	2,500	2,593	2,414
language/health barrier, incomplete callbacks	- 425	- 831	- 637	484	- 584
contacted numbers	1,378 [76%]	1,478 [64%]	1,863 [75%]	2,109 [81%]	1,830 [76%]
refusals	- 488	- 606	- 950	-1,202	- 920
cooperating	890 [65%]	872 [59%]	913 [49%]	907 [43%]	910 [50%]
ineligible	- 47	- 35	- 81	- 29	- 56
eligible	843	837	832	878	854
interrupted, incomplete	- 43	- 37	- 32	- 78	- 50
completions	800 [95%]	800 [96%]	800 [96%]	800 [91%]	804 [94%]
Response rate = contact % x cooperation % x completion %	47%	36%	35%	32%	36%

To investigate the potential for such bias, we compared the characteristics of our respondents with known characteristics of the population. The known characteristics are based on the 1990 Census, with adjustments by information collected from the Current Population Survey in the months immediately preceding data collection. Table 6.2 summarizes these comparisons. Asian/Pacific Islanders and black respondents were underrepresented in most communities, but the survey respondents show a strong correspondence with the population estimates on the race variable. Men are underrepresented in Alaska, Pittsburgh, and Seattle, though not grossly so. Respondents under 30 years of age are underrepresented in all communities except Alaska. However, only in Denver are persons over 65 years of age overrepresented in the sample. Overall, respondents are reasonably similar to the population parameters of sex and age in all five communities. However, this does not guarantee that nonrespondents would not have responded differently than respondents.

SOMER'S D: LOOKING AT THE RELATIONSHIP BETWEEN QUESTIONS

In reviewing the survey results, we are frequently interested in knowing whether people who answer a particular way on one question also tend to answer a particular way on a different question. For example, past research has observed that people who have acquired more education are more likely to attend arts events than people with less education. This finding comes from looking at the relationship between two different variables—*education level* and *frequency of attendance*.

Somer's d is a statistic that shows the strength of the relationship between two variables with a small number of ordered categories. By “ordered,” we mean that the question has categories that run in a meaningful way from low to high. Somer's d indicates the extent to which respondents who report high or low values on one variable also report high or low levels on another variable. For example, if we observe that tall people are very talkative and short people say very little at all, we would expect a high value of Somer's d for the variables *height* and *verbosity*. On the other hand, if tall and short people have roughly the same number of talkative and nontalkative types, we would get a low Somer's d, and we would conclude that there is no relationship between the two variables.

Somer's d runs from a value of 0.0 (no relationship) to 1.0 (perfect relationship), although it is usually quite low because of the conservative way in which it is calculated. A positive sign (+) in front of the number means that there is a *positive relationship* between the variables; that is, high values on one variable are associated with high values on the other. A negative sign (–) indicates a *negative relationship*; that is, high values on one variable go with lower values on the other variable, and vice versa.

A value of Somer's d less than –0.15 or higher than +0.15 is worth paying attention to. For values closer to 0.0, the relationship is probably best thought of as weak or nonexistent. Throughout this report, we note relationships that meet or exceed this 0.15 threshold.
